

KIDNEY HEALTH

Understanding Chronic Kidney Disease (CKD)

Information for Jarran, Stella and your family

Early Care, Healthy lifestyle changes and community support can slow kidney damage and improve quality of life

Smoking increase kidney damages

Diabetes is cause of CKD

High blood pressure damage kidney

Testing help detect CKD early

What is CKD?

- CKD happens when kidneys slowly stop filtering waste properly.
- Waste and extra fluid build up in the body.
- Diabetes and high blood pressure are major causes.
- Early treatment can slow disease progression.

COMMON SYMPTOMS

- Tiredness
- Swelling
- Nausea
- Changes in urination

What Tests Will I Need?

- **eGFR Blood Test** – checks how well kidneys are working.
- **Creatinine Test** – measures waste level in the blood.
- **Urine Test** – checks for protein or blood in urine.
- **Ultrasound** – checks kidney size and structure.

eGFR Blood Test
Check how well kidneys are working

URINE TEST

How to Live Well & Slow CKD

- Take medicines as prescribed.
- Manage diabetes and blood pressure.
- Follow a healthy eating plan – reduce salt, eat more fruit and vegetables, limit processed foods and sugary drinks.
- Stay physically active – activities like walking help your overall health.
- Stop smoking – it slows kidney damage and improves heart health.
- Attend regular health checks and follow up with your healthcare team.

eGFR
Healthy eating an plenty of water

Stay Active Everyday

Quit Smoking

Community and cultural support

Strong family, cultural connection and community support improve wellbeing. Engage with Aboriginal Medical Services, community nurses and use telehealth when needed, especially in remote areas.
